

CSED332: Software Design Methods

Lecture 3: Agile

Kyungmin Bae

Department of Computer Science and Engineering
POSTECH

Last Lecture: Testing

- ▶ Software testing
 - ▶ test cases, test suites, test oracles, . . .
 - ▶ JUnit and test automation
- ▶ Test coverage
 - ▶ equivalence partitioning, boundary analysis, combinatorial testing
 - ▶ structural coverage: method, statement, branch, condition

This Lecture: eXtreme Programming

- ▶ What is eXtreme Programming (XP)?
- ▶ How extremely does XP differ?
- ▶ When (not) to use XP?

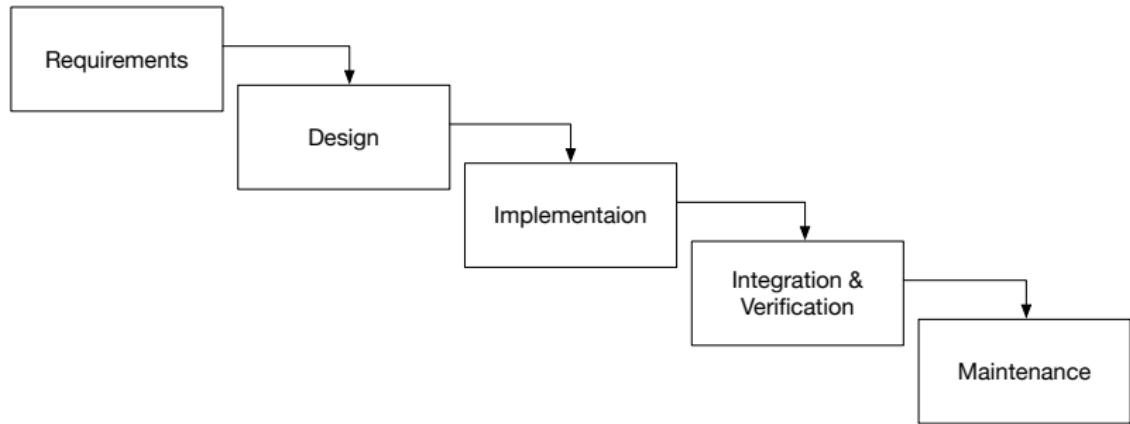

Many Way to Develop Software

- ▶ Plan-driven / agile
- ▶ Centralized / distributed
- ▶ High math / low math
- ▶ Close / little interaction with customers
- ▶ Much testing / little testing
- ▶ Organize by architecture / features
- ▶ ...

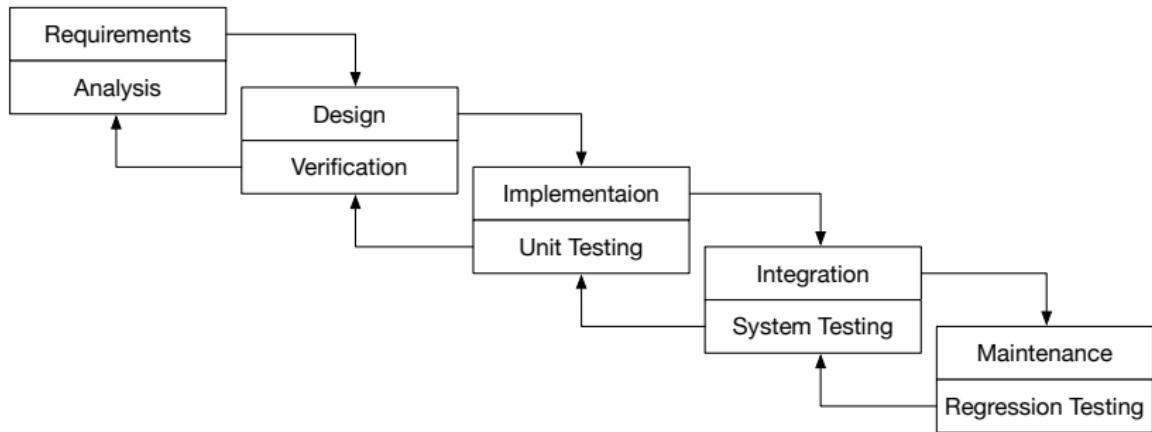

Plan-Driven Process: Waterfall Process Activities

- ▶ Requirements: what software should do
 - ▶ Design: structure code into modules
 - ▶ Implementation: write code
 - ▶ Integration: put modules together
 - ▶ Testing: check if code works
 - ▶ Maintenance: keep making changes
- Often merged together as Verification

Theoretical Waterfall Model

Real-Life Waterfall Model

Agile Process: eXtreme Programming (XP)

- ▶ Different from the **rigid waterfall process**
 - ▶ replace it with a **collaborative** and **iterative** design process
 - ▶ **respond quickly** to changing requirements
- ▶ Main figure: Kent Beck

Main Ideas of XP

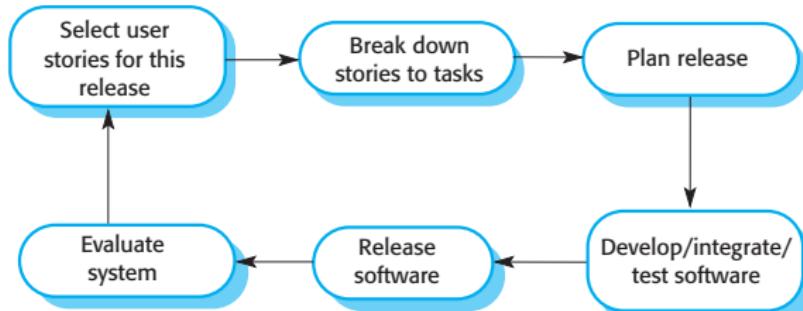

- ▶ Do not write excessive documentation
 - ▶ working **code and tests** are the main written product
- ▶ Implement features one by one
- ▶ Release code frequently
- ▶ Work closely with the customer
- ▶ Communicate a lot with team members

XP: Some Key Practices

- ▶ Planning game for requirements and user stories
- ▶ Test-driven development for design and testing
- ▶ Refactoring for design and implementation
- ▶ Pair programming for development
- ▶ Continuous integration for integration

XP is an Iterative Process

- ▶ **Iteration** = two week cycle (1-3 weeks)

1. **Plan** each iteration in **iteration meeting** at the start of the iteration
2. Iteration is going to implement set of **user stories**
3. Divide work into **tasks small** enough to finish in a day
4. Each day, programmers **work in pairs** to finish tasks

Pair Programming

<https://collaboration.csc.ncsu.edu/laurie/pair.html>

What Is Pair Programming?

*Pair programming is a simple, straightforward concept. Two programmers work **side-by-side** at **one** computer, continuously collaborating on the **same** design, algorithm, code, and test. It allows two people to produce a **higher quality** of code than that produced by the summation of their solitary efforts.*

— Laurie Williams

- ▶ **Driver:** types or writes
 - ▶ coding, design, debugging, testing, etc.
- ▶ **Navigator:** observes
 - ▶ looking for tactical and strategic defects
- ▶ Periodically switch roles of driver and navigator
 - ▶ possibly every 30 minutes or less

Example: Pair Programming

- ▶ Pair programming

- ▶ This is **NOT** Pair Programming
 - ▶ <https://www.youtube.com/watch?v=kE00-Q5D1fw>

Research Findings to Date

- ▶ Strong anecdotal evidence from industry

We can produce near defect-free code in less than half the time.

- ▶ Empirical Study

- ▶ Pairs produced higher quality code (15% fewer defects)
- ▶ Pairs completed their tasks in less time (58% of elapsed time)
- ▶ Pairs enjoy their work more (92%)
- ▶ Pairs feel more confident in their work products (96%)

- ▶ Measurements suggest

- ▶ productivity of pair is similar to that of two working independently

Benefits of Pair Programming

- ▶ Higher product quality
- ▶ Improved cycle time
- ▶ Increased programmer satisfaction
- ▶ Enhanced learning
- ▶ Pair rotation
 - ▶ ease staff training and transition
 - ▶ sharing of knowledge (reduced risk when team members leave)
 - ▶ enhanced team building

Issue: Partner Work

Best

Issue: Process

- ▶ Pair programming is an old concept
 - ▶ since the beginning of programming (1950s)
- ▶ Used extensively in eXtreme Programming
 - ▶ collective code ownership: everyone is responsible for all the code
- ▶ But also in other development processes
 - ▶ pair programming can be added to any process

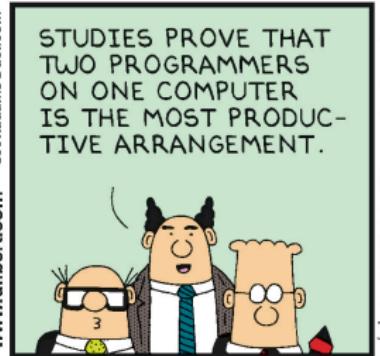

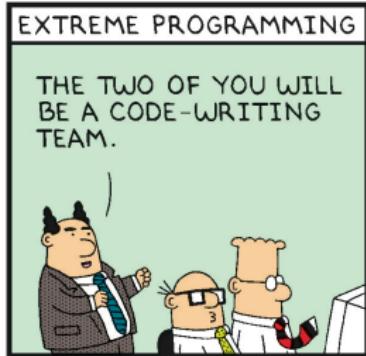

How Does This Work? (1)

- ▶ Pair Pressure
 - ▶ keep each other on task and focused
 - ▶ don't want to let partner down
 - ▶ "embarrassed" to not follow the prescribed process
- ▶ Pair Negotiation
 - ▶ "searching through larger spaces of alternatives"
 - ▶ bring different prior experiences, while having shared goals
 - ▶ must negotiate how to approach the problem jointly
- ▶ Pair Courage
 - ▶ if it looks right to me and it looks right to you, ...
 - ▶ it's probably right!

How Does This Work? (2)

- ▶ Pair Reviews
 - ▶ “four eyeballs are better than two”
 - ▶ continuous design and code reviews
 - ▶ removes programmers’ distaste for reviews
- ▶ Pair Debugging
 - ▶ explaining the problems to another person
 - ▶ “never mind; I see what’s wrong. sorry to bother you.”
- ▶ Pair Learning
 - ▶ learn from partners techniques, knowledge of language, domain, . . .
 - ▶ take turns being the teacher and the student minute by minute

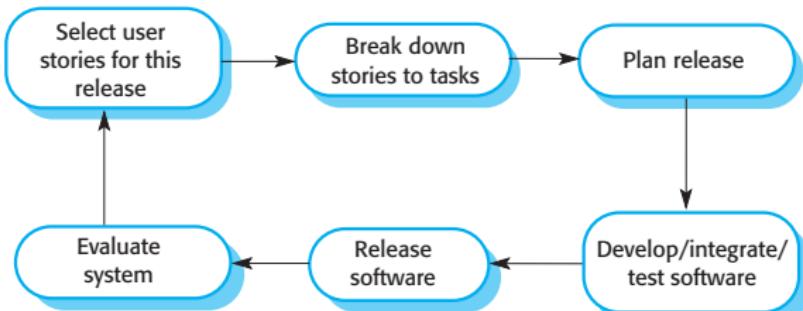

Pairs Means Working Together

User Stories

XP is an Iterative Process

- ▶ Iteration = two week cycle (1-3 weeks)

1. Plan each iteration in iteration meeting at the start of the iteration
2. Iteration is going to implement set of **user stories**
3. Divide work into tasks small enough to finish in a day
4. Each day, programmers work in pairs to finish tasks

What are User Stories?

A user story is the smallest amount of information (a step) necessary to allow the customer to define (and steer) a path through the system.

— David Astels, et al.

- ▶ A user story represents :
 - ▶ a feature **customers want** in the software
- ▶ Written by our **customers** (communication with developers)
 - ▶ and not by developers (?)
- ▶ Typically written on **index cards**

Writing User Stories

- ▶ Materials
 - ▶ a stack of blank index cards, pens or pencils, rubber bands
- ▶ Start with a goal of the system
 - ▶ e.g., applicant submits a loan application
- ▶ Think about the steps that the user takes
 - ▶ as the user does the activity
- ▶ Write no more than one step on each card
 - ▶ do not make it too complex

Format of a User Story

- ▶ Title: 2–3 words
- ▶ Acceptance test
- ▶ Priority: 1–2–3 (1 most important)
- ▶ Story points (e.g., the number of days of ideal development time)
- ▶ Description: 1–2 sentences (a single step towards achieving goal)

Title: Enter Player Info		
Acceptance Test: enterPlayerInfo1	Priority: 1	Story Points: 1
Right after the game starts, the Player Information dialog will prompt the players to enter the number of players (between 2 and 8). Each player will then be prompted for their name, which may not be an empty string. If Cancel is pressed the game exits gracefully.		

Example: Acceptance Test for a Story

- ▶ Create Receipt

Keep a running receipt with a short description of each scanned item and its price.

- ▶ Test

Setup: The cashier has a new customer

Operation: The cashier scans three cans of beans (\$0.99 each), two pounds of spinach (\$0.59/lb), and a toothbrush (\$2.00)

Verify: The receipt has all of the scanned items and their correctly listed prices.

Priorities

- ▶ High
 - ▶ "Give us these stories to provide a minimal working system."
- ▶ Medium
 - ▶ "We need these stories to complete this system."
- ▶ Low
 - ▶ "Bells and whistles? Which stories can come later?"

Story Points

- ▶ Unit of measure
 - ▶ the overall size of a user story, feature, or other piece of work.
 - ▶ **NOT** amount of time or the number of people
- ▶ Relative values
 - ▶ raw value of a story point is unimportant
- ▶ Estimating story points
 - ▶ choose a medium-size story and assign it, e.g., **5**
 - ▶ estimate other stories relative to that

Criteria for User Stories

- ▶ **Independent**: of each other as much as possible
- ▶ **Negotiable**: understandable to the customer, not a contract
- ▶ **Valuable**: must provide value to the customer
- ▶ **Estimable**: to a good approximation
- ▶ **Small**: so as to fit within an iteration
- ▶ **Testable**: in principle, even if there isn't a test for it yet

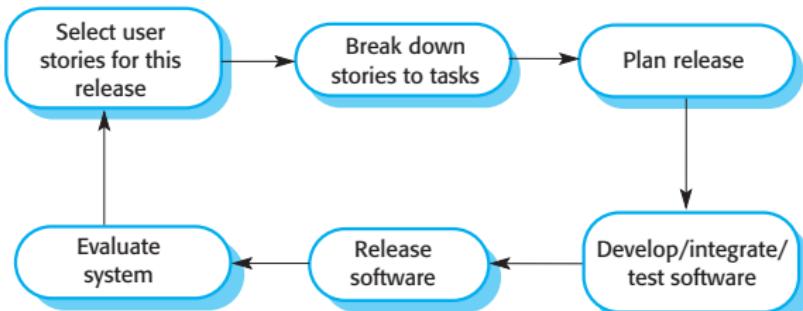

Need Educated Customer

Planning Game¹

XP is an Iterative Process

- ▶ **Iteration** = two week cycle (1-3 weeks)

1. **Plan** each iteration in iteration meeting at the start of iteration
2. Iteration is going to implement set of **user stories**
3. Divide work into tasks small enough to finish in a day
4. Each day, programmers work in pairs to finish tasks

How to Plan

- ▶ Make a **list**
 - ▶ everything you have to do
- ▶ Decide **when you will do** each thing
 - ▶ How long will it take?
- ▶ Make sure you have **what you need** for each task
 - ▶ e.g., dependencies between different tasks

How Long Will It Take?

- ▶ Compare with other tasks
 - ▶ you have previously done
- ▶ Break into smaller steps
 - ▶ when too hard to estimate
- ▶ Get several people to estimate
 - ▶ to consider different aspects

Planning Game

- ▶ Customer writes **user stories**.
 - ▶ only provide enough detail to estimate time to implement the story
- ▶ Programmers **estimate time** to do each story.
 - ▶ If story is too big, customer splits it
- ▶ Customer chooses stories to be implemented that match **velocity**.
 - ▶ project velocity is amount of work done in the previous iteration(s)

Example: Coming up with the Plan

- ▶ Desired Features: a user story is given by a customer
- ▶ Estimate Size: 30 story points
- ▶ Divide by Velocity: 5 story points / two week iteration
- ▶ Derive Duration: 6 iterations
- ▶ Iteration/Release Plan: 3 months

Estimating Size

- ▶ **Story point:** unit of measure
 - ▶ the overall size of a user story, feature, or other piece of work.
 - ▶ **NOT** amount of time or the number of people
- ▶ **Ideal time:**
 - ▶ the amount of time, stripped of all peripheral activities
 - ▶ E.g., soccer game = 90 minutes
- ▶ **Elapsed time:**
 - ▶ the amount of time that passes on the clock
 - ▶ E.g., soccer game = 2 hours
- ▶ **Velocity**
 - ▶ a measure of how much work is getting done on your project.
 - ▶ sum of the estimates of the user stories finished during the iteration

Estimating Story Points

- ▶ Choose a medium-size story and assign it a “5”
 - ▶ based on how hard to implement it
 - ▶ **not** relate to actual hours; only relative
- ▶ Estimate other stories relative to that
 - ▶ twice as big
 - ▶ half as big
 - ▶ almost but not quite as big
 - ▶ a little bit bigger
- ▶ Only values

0 1 2 3 5 8 | 13 20 40 100

← Near-term iteration “stories”

a few iterations away “epic” →

Estimating Ideal Days

- ▶ Ideal days vs. elapsed time
 - ▶ supporting current release
 - ▶ meetings, demonstrations
 - ▶ sick time, phone calls, personal issues
 - ▶ ...
- ▶ When estimating ideal days, assume
 - ▶ the story being estimated is the only thing you will work on
 - ▶ everything you need will be on hand when you start
 - ▶ there will be no interruptions

Ideal Days vs. Story Points

- ▶ Both are units of predicted effort
- ▶ Story points:
 - ▶ pure measure of size (focus on feature, not person)
 - ▶ helps drive cross-functional behavior
 - ▶ estimation is typically faster in the long run
- ▶ Ideal days:
 - ▶ my ideal days are not your ideal days (focus on person)
 - ▶ easier to explain outside of team
 - ▶ estimation is typically faster at first

Deriving an Estimate for a User Story

- ▶ Expert opinion
 - ▶ based on (extensive) experience
 - ▶ one expert not be enough (need to consider all aspects)
- ▶ Analogy
 - ▶ relative to (several) other user stories
 - ▶ triangulation: little bigger than “3” and a little smaller than “8”
- ▶ Disaggregation
 - ▶ break up into smaller, easier-to-estimate pieces or tasks.
 - ▶ need to make sure you do not miss any tasks.
- ▶ Planning poker
 - ▶ combines expert opinion, analogy, disaggregation
 - ▶ avoids the cognitive bias of anchoring

Planning Poker Deck

Playing Planning Poker

- ▶ Include all players on the development team:
 - ▶ but less than 10 people overall
 - ▶ programmers, testers, requirements analysts, UI designers, . . .
- ▶ Moderator (usually the product owner or analyst)
 - ▶ read the description (e.g., user stories) and answer any questions
- ▶ Each estimator privately selects a card with their estimate
- ▶ All cards simultaneously turned over
- ▶ Re-estimate
- ▶ Repeat until converge

Velocity

- ▶ A measure of a team's rate of progress.
 - ▶ how much work is getting done on your project
- ▶ Summing up the story points assigned to the user stories
 - ▶ that the team **completed** during the iteration
- ▶ Assumption
 - ▶ team produces in future iterations at the rate of past velocity
- ▶ If velocity **changes dramatically** for more than one iteration
 - ▶ need to re-estimate and re-negotiate the release plan

Example: Release Plan

- ▶ Desired Features: a user story given
- ▶ Estimate Size: 30 story points
- ▶ Divide by Velocity: 5 story points / 2 week iteration
- ▶ Derive Duration: 6 iterations
- ▶ Release Plan: 3 months

Example: Not Working as Fast as Planned?

- ▶ Desired Features: a user story given
- ▶ Estimate Size: 30 story points
- ▶ Divide by Velocity: 3 story points / 2 week iteration
- ▶ Derive Duration: 10 iterations
- ▶ Release Plan: 5 months

Example: Not Working as Fast as Planned?

- ▶ Desired Features: a user story given
- ▶ Estimate Size: 18 story points
- ▶ Divide by Velocity: 3 story points / 2 week iteration
- ▶ Derive Duration: 6 iterations
- ▶ Release Plan: 3 months

Velocity Corrects Estimation Errors

- ▶ The velocity should change, **not** each story point estimate
 - ▶ to re-estimate and re-negotiate the release plan for future releases
- ▶ Since all user stories are estimated relative to each other

Prioritization

- ▶ Driven by customer, in conjunction with developer
 - ▶ which user stories to be implemented?
- ▶ Choose features to fill up velocity of iteration
 - ▶ a feature to a broad base of customers or users
 - ▶ a feature to a small number of important customers or users
 - ▶ the cohesiveness of the story in relation to other stories
- ▶ Cohesiveness example
 - ▶ “Zoom in” a high priority feature
 - ▶ “Zoom out” not a high priority feature but relative to “Zoom in”

Priorities (Revisited)

- ▶ High
 - ▶ "Give us these stories to provide a minimal working system."
- ▶ Medium
 - ▶ "We need these stories to complete this system."
- ▶ Low
 - ▶ "Bells and whistles? Which stories can come later?"

Example: Planning Game (2)

- | | | |
|-----------|--|-----------------------------------|
| Customer | Desired Features: | a user story given |
| Developer | Estimate size (too big) | 100 story points |
| Customer | Split the user story | 8 user stories |
| Developer | Estimate Size: | 20 story point each |
| | Divide by Velocity: | 5 story points / 2 week iteration |
| | Derive Duration: | 8 * 4 iterations |
| | Release Plan (small releases): | 8 * 2 months |
| Customer | Choose stories to be implemented first | |

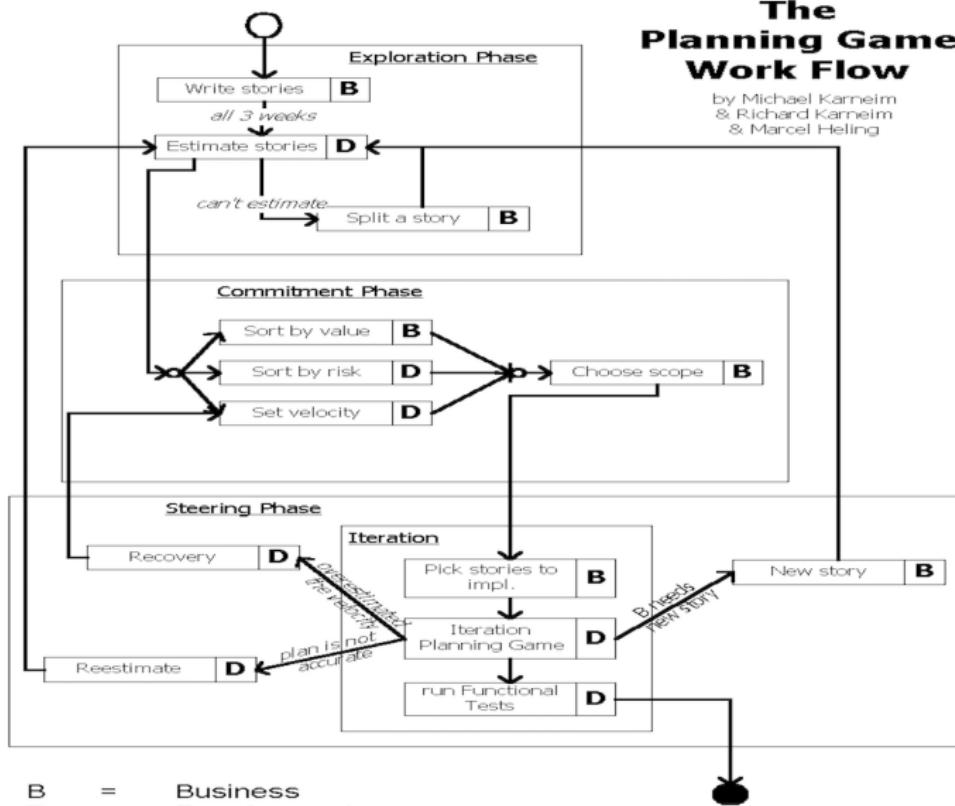

Iteration Planning

At the beginning of each iteration

- ▶ Customer selects user stories
 - ▶ with estimates that total up to the velocity from the last iteration.
- ▶ User stories are broken down into the programming tasks
 - ▶ developers sign up to do the tasks
- ▶ Developers estimate how long their tasks will take to complete
 - ▶ ideal days or story points
- ▶ Velocity used to determine if the iteration is overbooked or not
 - ▶ too much: the customer must choose user stories to be put off
 - ▶ too little: another story can be accepted

The Planning Game Work Flow

by Michael Karmel
& Richard Karmel
& Marcel Helmig

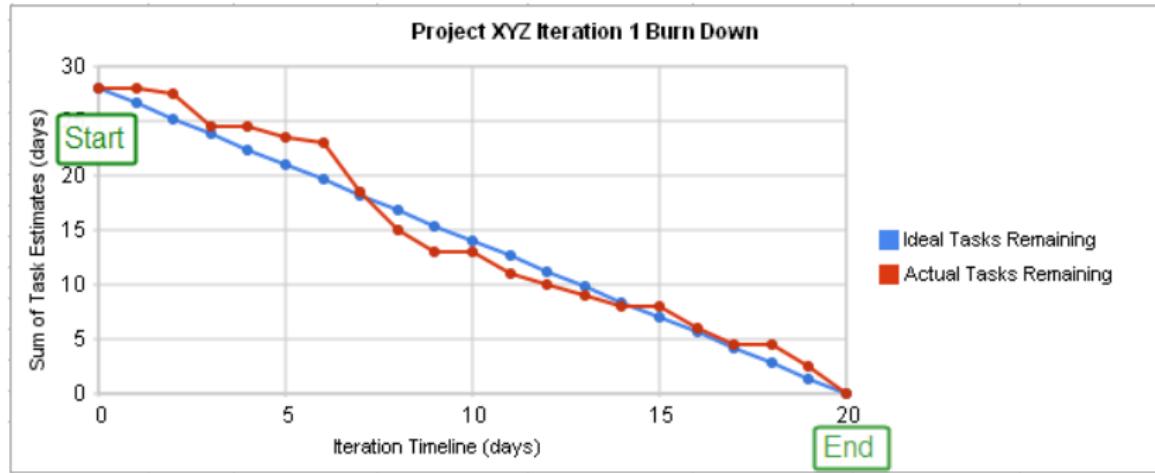

Project Tracking

- ▶ Keep track of when each task is finished
 - ▶ must be objective (e.g., “wrote a program” not “learned language”)
 - ▶ different tasks are evaluated differently
- ▶ Compare plan to reality
 - ▶ estimated vs. actual completion date
- ▶ Tasks are either finished or not
 - ▶ forbid “90% finished” – decompose tasks
 - ▶ in XP, programming task is not finished until all tests run correctly

Your project

Update documents on GitLab to reflect completion dates.

Burn Down Chart

- ▶ Shows the amount of work remaining at the start of each iteration
 - Vertical axis: number of story points or hours remaining
 - Horizontal axis: iterations (or days)
- ▶ Visual indicator of how quickly a team is moving toward its goal

Difficulties in Scheduling

- ▶ Productivity is **not proportional** to the number of people
 - ▶ tasks cannot be fully partitioned to individuals in practice
 - ▶ require communication among subtasks
- ▶ Adding manpower to a late software project makes it later
 - ▶ called Brooks' law
 - ▶ communication overheads and training
- ▶ The unexpected always happens
 - ▶ always allow contingency in planning

Unit Tests and Refactoring

Simplicity

- ▶ Add one feature (user story) at a time
 - ▶ Programmers only worry about one iteration at a time
- ▶ Do not worry about future stories
 - ▶ Customer can change future iterations
- ▶ Make program as simple as possible
 - ▶ The simplest thing that could possibly work

Recover Simplicity

- ▶ Adding a new feature
 - ▶ tends to make the code less simple
- ▶ Refactoring the code
 - ▶ recover simplicity back
- ▶ Safe refactoring
 - ▶ requires to have a rigorous set of unit tests

Refactoring

- ▶ **Changing the structure** of program **without changing its behavior**
 - ▶ make code easier to understand
 - ▶ make code cheaper to modify
- ▶ Some refactoring
 - ▶ rename, rename, rename
 - ▶ extract method and local variable
 - ▶ encapsulate field
 - ▶ ...
- ▶ Automated refactoring support (e.g., Eclipse)

Working Software

- ▶ All software has automated (unit) tests
- ▶ All tests pass, all the time
- ▶ Never check in broken code to the repository

How to Work on a Task

- ▶ Get latest version of the code. All tests pass.
- ▶ Write **test first**. It fails.
- ▶ Write code to make test pass. Now all tests pass.
- ▶ **Refactoring** (clean up)
- ▶ Check in your code (plus smoke testing)

One Key Practice

- ▶ Write **tests first**, then write code
 - ▶ tests will initially fail
- ▶ Various names
 - ▶ Test-first programming
 - ▶ **Test-driven development**
- ▶ Is it testing or designing?
 - ▶ does not find bugs, but prevents them
 - ▶ does not measure quality, but improves it

Why Test?

- ▶ Improve quality: find faults
- ▶ Measure quality
 - ▶ Prove there are no bugs? (Is it possible?)
 - ▶ Determine if software is ready to be released
 - ▶ Determine what to work on
 - ▶ See if you made a mistake
- ▶ Learn the software

XP Specification and Testing

- ▶ Talk about specification when writing unit tests
 - ▶ write tests and then code
 - ▶ document code
- ▶ Customer (team) writes functional tests (acceptance test)
 - ▶ tests are derived from user stories
 - ▶ tests need to be documented to ensure traceability to user stories

XP and Test Coverage

- ▶ Measure coverage periodically
 - ▶ at end of iteration?
 - ▶ use automated tools
- ▶ Use as feedback
 - ▶ To write more tests
 - ▶ To improve how you write tests

Summary

- ▶ Core XP practices
 - ▶ pair programming, user stories, planning game, testing, refactoring
- ▶ Homework 3 (Due **10/2**):
 - ▶ More Java, JUnit, and Maven
- ▶ Reading
 - ▶ https://en.wikipedia.org/wiki/Agile_software_development
 - ▶ <http://www.extremeprogramming.org>
